PACKAGING BY NATURE

3D packaging: The revolution in the packaging industry

- With 3D packaging, the package becomes as unique as your products.
- 3D packaging stands out immediately and attracts your customers' interest – a unique selling point for the product in stores.

THINK OUTSIDE THE BOX

Environmental and sustainable

No plastic, no adhesive, just one basic material:

The 3D packaging is made entirely of environmentally-friendly material, can be FSC-certified on request and is easily recycled and composted.

Simple, safe and cost-saving

- The inlay of the 3D packages is moulded in one piece so it fits the product like a second skin and provides perfect protection. 3D packaging is easily integrated in production. The environmentally-compatible material is completely recyclable, thus reducing your production and disposal costs.
- The look and feel of the 3D packaging communicates the shape and quality of its contents.
- Stably stackable 3D packaging is also available on request: The top and bottom sides of the packages are made using the lock and key principle so that the packages engage with each other when stacked and fix firmly together.
- With easily recyclable 3D packaging you – and your customers – can have a clear eco-conscience. Use our 3D packaging as a convincing argument to gain and keep hold of environmentally aware customers.

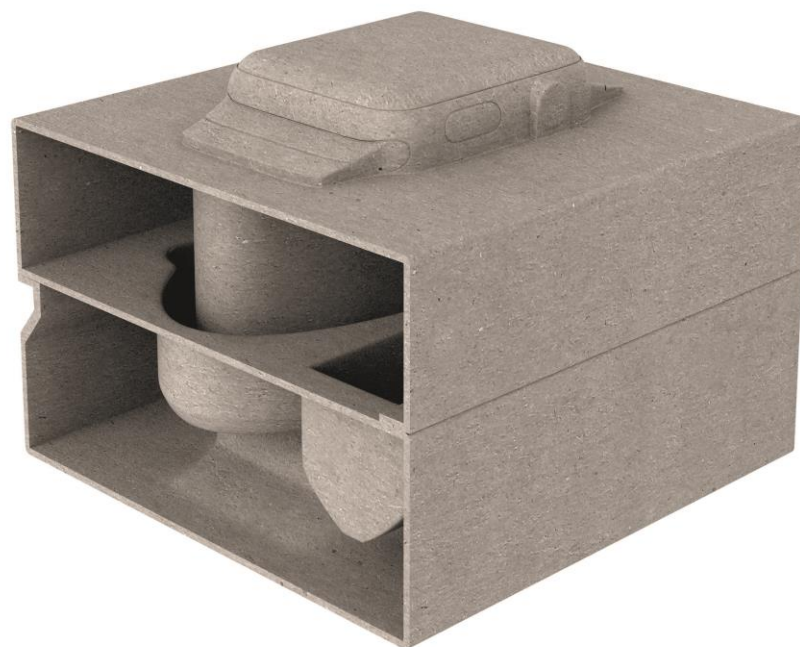

The (r)evolution of the packaging industry

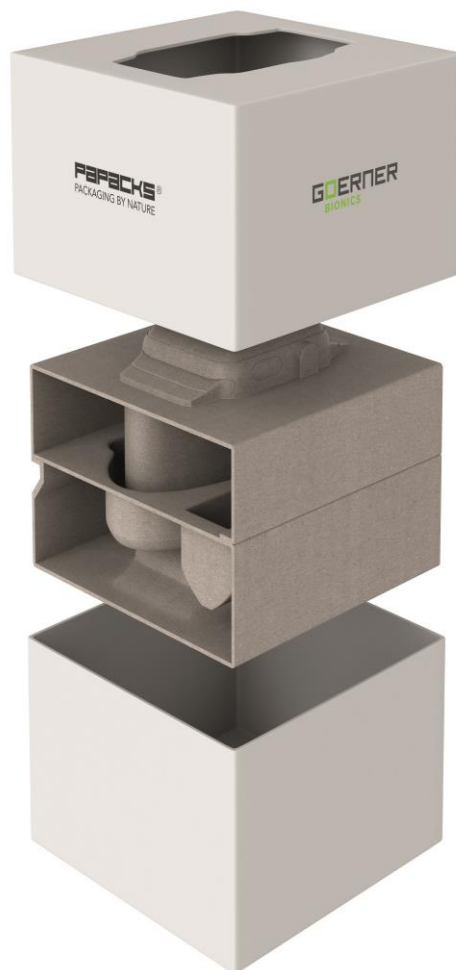

- Our 3D packaging is a completely new development: We merge cardboard packaging with moulded pulp parts. As a result, you can shape your future marketing with an infinite range of customized packaging shapes. Your packages will be as unique as you and your products.
- Our expertise brings all the components together in an ideal shape: With top and bottom sides made using the lock and key principle, you can stack products to create attractive displays that are very stable. At the same time, every package looks both extraordinary and unique. Your customers' experience of the packaged product starts with its high-quality packaging. 3D look and feel communicates the shape and quality of the contents.
- The insides of our high-quality 3D packages are just as contoured. Products are fittingly and coherently presented in perfectly shaped inlays. Environmentally-friendly moulded fibre surrounds your products like a second skin, enabling you to minimize material, space and weight. You can stack and store more easily, your customers can buy and transport more easily. The inside of our packages protects while the outside clearly says: What you see is what you get.
- **In future, give your customers two products in one: Your items in our exciting 3D packaging.**
