

**GOERNER**  
GROUP

intelligent packaging  
needs smart thinkers!

## Nothing is more constant than change

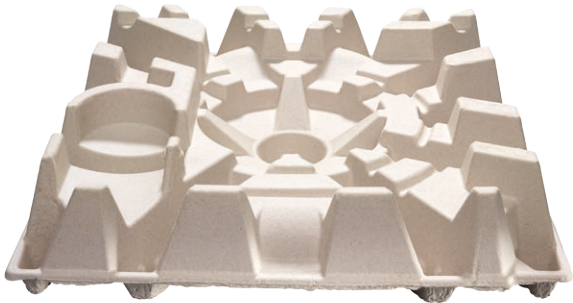

The Goerner Group is a supplier for the technical industry and the food industry. We stand for quality, technology and innovation. We pursue the claim of not only responding to the upheaval of social conditions and to the rapid development in almost all fields of technology but also of playing an active role in this change. Actively designing is our particular passion and we practice and uphold this in cooperation with non-profit institutions. From it we draw strength and inspiration for our daily work.

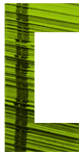

## The logical alternative to polystyrene and plastic

An idea thought through to its conclusion. The cardboard waste of Goerner Packaging is the raw material for the products of Goerner Formpack. Our moulded pulp parts made from recycled cardboard save on purchasing and disposal costs, are nestable, absorb shocks, can be integrated in automated packaging processes and are so treatable that they can be made grease- or water-repellent. They are antistatic anyway. Creative technology is required to combine sometimes ostensibly opposing attributes using innovative solutions.

## We have mastered the fine art of flexibility

We meet the specific needs of industry at our sites in Austria and Romania. Packaging material made from cardboard for the technical industry is produced in Romania with extensive manufacturing expertise. We meet the special requirements of the food industry at our Austrian site. We see ourselves as a packaging supplier that develops process optimizations for our customers which bring productivity, flexibility and cost savings.

## **Innovation is the encounter with the seemingly impossible.**

Modern technology copies clever solutions from nature. Based on the ingenious designs that nature provides us with, we have pooled our activities relating to alternative solutions in Goerner Bionics. Beyond the company boundaries, we see ourselves as an open concept which works on intelligent and resource-saving products with partners from industry and research establishments. Developments in the construction of vehicle parts and biological applications in the construction industry are just the beginning.
